

PROJECT NAME: Huntsville and Eden Area Water Systems Optimization Project

RECIPIENT: Weber Basin Water Conservancy District

LOCATION: Ogden, UT

PURPOSE: The Ogden Valley is a rural valley, east of the Wasatch Front, located on the Ogden River. There are currently 32 public water systems and 350 additional private wells providing drinking water to a population of approximately 12,000. There are also 15 different irrigation systems and only three small wastewater systems in the valley. Most of the waste water is disposed through single residential septic systems. The county officials, the residences, and most of the water purveyors within the valley are very interested in consolidating all of these systems into three or four master systems to more effectively and efficiently provide services to the residences and communities. This would first involve completing an ongoing study of the options, constructing water treatment facilities for wastewater and drinking water, constructing miles of distribution piping and piping two major canals that would feed a pressure irrigation system for the valley.

AMOUNT: \$850,000
